Center for Infectious Disease Research and Policy [\[back to top\]](#)

[Chest x-ray may underestimate infections](#) (2010-06-17)

To gauge the relationship between symptoms and signs of disease on radiographic tests, researchers reviewed records of 157 hospitalized patients who had confirmed pandemic H1N1 infections. Researchers report in the *British Journal of Radiology* that chest x-ray abnormalities were found in only 33% of cases and were linked to breathing difficulties. The test was less sensitive than computed tomography among immunocompromised patients.

[Autopsy study finds unique traits of H1N1 flu](#) (2010-06-17)

An autopsy study of H1N1 patients found peripheral pulmonary vascular thrombosis occurred in 5 of the 8 fatal cases, compared with 3 of 8 controls, according to an *American Journal of Clinical Pathology* report. Researchers also found cytophagocytosis in all of the flu-related cases. They found that the two features distinguished H1N1 cases from other flu types and that hemophagocytic syndrome should be suspected in severe H1N1 patients.

[London reviews its pandemic flu response](#) (2010-06-16)

A report today from the London Assembly gave high marks to the local pandemic response, but listed several areas for improvement. The report, based on several meetings of health officials, said the pandemic plan should have considered a range of severity scenarios and that antiviral distribution points weren't evenly dispersed. Requests for data from multiple agencies sometimes overburdened local officials, and more efforts were needed to reach vulnerable groups and improve immunization rates.

[India's health ministry to probe increase in cases](#) (2010-06-16)

A team from India's health ministry will assess a rise in pandemic flu illnesses and deaths in Kerala state that occurred over the past month after a monsoon hit the area, Indo-Asian News Service reported yesterday. Since May 15, 201 cases and 16 deaths have been reported, of which 9 were pregnant women. An official said extra antiviral medication and vaccines are being deployed to the area. Four flu deaths were also recently reported from two other Indian states, Maharashtra and Karnataka.

[Contrasting vaccine supplies in Malta, Kuala Lumpur](#) (2010-06-15)

Only 92,043 doses of pandemic H1N1 vaccine were dispensed in Malta, and the government has 239,620 remaining. No decision has been made on what to do with the leftovers. It is estimated that the country spent 2.5 to 3 million euros on the stockpile. The situation is reversed in Kuala Lumpur, Malaysia, according to [bernama.com](#), the country's national news agency. Only about 31,000 doses remain of the 400,000 purchased.

[Record numbers vaccinated in New Zealand](#) (2010-06-15)

The health minister of New Zealand says more than 1 million in the country have received flu vaccinations this year, setting a record, according to the New Zealand Press Association (NZPA). Last year 960,000 people were vaccinated. This year's flu shot includes the H1N1 pandemic strain. Cases of flu-like illness have increased in New Zealand over the past 2 weeks, with 18 pandemic H1N1 cases so far this year, and health officials are continuing to promote vaccination.

[Vietnam considers lowering H1N1 alert level](#) (2010-06-14)

The deputy minister of health in Vietnam has suggested lowering the alert level for pandemic H1N1 flu there, given that Vietnam has had no reports of the disease for more than 2 months. The World Health Organization (WHO) has not suggested this move, but the minister said the the health ministry had "heard" that the WHO had blown the pandemic out of proportion at the urging of pharmaceutical companies, an accusation the WHO strongly refutes.

[Australian girl's autopsy shows no vaccine link](#) (2010-06-14)

Autopsy results show no evidence linking the April death of a 2-year-old Brisbane girl to the trivalent seasonal flu vaccine she had received a day earlier. But no clear cause of death was found, leaving some observers unconvinced. Because of increased adverse reactions, the seasonal vaccine is on hold for Australian children under 5. (*Note: An earlier version of this item wrongly indicated the girl had received monovalent pandemic H1N1 vaccine. H1N1 is included in the trivalent vaccine.*)

[Seroconversion with oseltamivir prophylaxis](#) (2010-06-11)

Postexposure prophylaxis an effective way to mitigate pandemic flu outbreaks, says a study published today. The authors tested 237 military members in Singapore during and after oseltamivir prophylaxis. Infection occurred in 27 (11.4%), including 11 index cases and 16 people with a four-fold or more rise in antibody titers during treatment; 8 of these had symptoms and 8 did not. The authors say asymptomatic infections that occur during prophylaxis may confer protection against future infection.

[Pandemic officially a year old](#) (2010-06-11)

Today marks the passage of a year since the World Health Organization (WHO) declared a pandemic of H1N1 influenza. WHO Director Margaret Chan declared phase 6 on Jun 11, 2009, about 7 weeks after the virus had surfaced. The WHO hesitated to take the step because of concern that it would cause undue alarm, given that H5N1 avian flu had led the public to associate "pandemic" with high death rates. Although H1N1 activity is now low in most of the world, the WHO has maintained the phase 6 alert.

[Limited global pandemic cases continue](#) (2010-06-11)

This week's flu surveillance report from the WHO indicates active but declining H1N1 flu transmission in limited tropical areas--specifically Singapore, Malaysia, Bangladesh, and Cuba. As the Southern Hemisphere enters its winter season, early H1N1 activity has been noted in Chile and Uruguay, plus increasing but low levels of seasonal H3N2 and influenza B over South America and H3N2 in East Africa.

[WHO defends pandemic actions, says rules need tightening](#) (2010-06-10)

The World Health Organization (WHO) replied at greater length today to recent criticism of the way it used science advisors in pandemic planning, defending its response to the H1N1 flu pandemic but allowing that its policies concerning transparency and relations with the pharmaceutical industry need strengthening.

[Three countries report growing flu activity](#) (2010-06-10)

Some parts of India and Colombia are reporting increases in pandemic flu activity, along with some deaths, while New Zealand, which is beginning its regular flu season, is reporting a rise in flu-like illnesses, particularly in young children.

[Much of Hong Kong vaccine to be tossed](#) (2010-06-10)

Only 200,000 of the 3 million H1N1 vaccine doses available in Hong Kong were administered, and the expiration date on the 2.8 million unused doses is approaching. The doses destined for the trash in October cost about \$28.2 million US. Hong Kong offered the vaccine free to health professionals, pregnant women, babies, the elderly, and patients at risk, but safety concerns in the population after several complications in recipients reduced demand.

[Greece data profile two waves of H1N1](#) (2010-06-10)

Data gathered in Greece from May 18, 2009, through Feb 28, 2010, showed two waves of pandemic H1N1, a milder one in July-August and a stronger one that peaked Nov 23 to 29. A total of 18,075 lab-confirmed cases were reported, including 294 admissions to intensive care and 140 deaths. Of patients who died, 115 (82.1%) had at least one underlying medical condition, the most common being obesity, diabetes, and cardiovascular disease; 89 (63.5%) were under 60 years of age, with 8 (5.7%) under 19.

[Studies examine H1N1 spread in military units, households](#) (2010-06-09)

When the H1N1 pandemic influenza began hitting Singapore's military forces last summer, health officials largely arrested its spread by giving oseltamivir to everyone in the affected units, in combination with other preventive steps, according to a report released today.

[WHO director replies to *BMJ* critique of pandemic actions](#) (2010-06-08)

The head of the World Health Organization (WHO), responding today to recent criticism of WHO policies regarding conflicts of interest and transparency, said the agency needs to tighten its rules for relations with industry but insisted that commercial interests never influenced her decisions regarding the H1N1 influenza pandemic.

[Expert warns against H1N1 complacency](#) (2010-06-08)

British virologist John Oxford stated at a recent Dublin conference that "It's too early to do a postmortem" on the pandemic H1N1 flu virus. He predicted it will cause trouble again in the coming winter. People need to be aware of how to limit its spread, and decisions need to be based on science, he said. As for vaccine, he stated, "It's no time to be complacent and say we wasted our money on vaccines, because we haven't. This is a virus that will be in the community for a long time."

[Pandemic exposed gaps in Canada's planning](#) (2010-06-08)

Canada's response to the H1N1 pandemic was one of confusion, says a white paper being presented today at the World Conference on Disaster Management in Toronto. Serious gaps in the country's pandemic planning and unrealistic management guidelines were exposed, it says. Dr. Allan Holmes, who moderated the roundtable discussion on which the report was based, said a single pan-Canadian approach to planning is needed, along with a severity index to put future outbreaks in context.

[Review shows Tamiflu safe, effective in babies](#) (2010-06-08)

Little is known about the safety and efficacy of oseltamivir (Tamiflu) in infants, but German researchers who reviewed cases of babies hospitalized with influenza found the drug yielded benefits similar to those in older children, though mild gastrointestinal symptoms were more common.

[Pandemic review committee to look at new reports](#) (2010-06-08)

Dr Harvey Fineberg, chairman of the World Health Organization's (WHO's) pandemic review committee, said the group would consider new reports published by the *British Medical Journal* and the Council of Europe that are critical of the WHO's H1N1 response, Agence France-Presse reported today. He said the committee's second meeting will be Jun 30 to Jul 2 in Geneva. The two reports, dismissed by some experts, say conflicts of interest may have swayed WHO decisions on vaccines and antivirals.

[German study compares summer, fall waves of cases](#) (2010-06-08)

A study of case-based surveillance in Germany suggests that school holidays and containment efforts may have led to differences in summer and fall 2009 pandemic flu waves, according to a report today in *BMC Infectious Diseases*. Increased fall spread didn't change risk groups or

severity, but the affected age-groups trended younger and the number of people with underlying medical conditions increased slightly. The authors said a case-based approach can help guide public health measures.

[Pandemic Influenza H1N1 2009 \(swine flu\) – Update 189](#)

The number of consultations for influenza-like illness has been increasing slowly, particularly over the past two weeks. Many general practices are seeing more young children who are unwell. There is certainly evidence of winter illnesses in the community and the predominant influenza virus is likely to be the pandemic strain.

Healthline, New Zealand's free health 24 hour health advice line is also seeing a steady increase in the number of calls regarding people with influenza-like illnesses - there's been a noticeable increase in the number of people calling for advice about illness in young children.
